

Activated Sheet

1. What is activation?

Concerning water, when the cluster of water is decomposed to the level of molecule by cutting the covalent bond, the electron starts vibration so that the long wave infrared rays (terahertz wave) is emitted. And also the same phenomenon is occurred for plastics like polypropylene (PP), vinyl chloride, polyethylene and also some of metals. M-AS made from polyvinyl chloride is denatured by the strong electromagnetic wave and emits continuous terahertz waves.

Activation

The cluster of water (H₂O) is broken down by the long wave infrared rays.

When the cluster of water is broken down to the level of molecule, small molecules restrain water to expand when freezing.

The activation of water by the long wave infrared rays = Restraint of expansion when freezing

The activated water in the freezer

The water that was activated by the activated sheet was not expanded at all. 300 mL water when freezing was just 300 mL of ice as the photo bellow.

The pure water in the freezer

The beaker was completely cracked by the expansion when freezing as the photo bellow.

Verification test for a sardine

Left side photo is no treatment

Right side photo is in the activated sheet

Freezing for 24hours in freezer and then thawing for 4 hours in the room temperature

No treatment, the drip can be found for both side

In the activated sheet, no change at all

2. The reason why the metabolism is improved by the long wave infrared rays

The wave length of the long wave infrared rays is middle between a ray and an electromagnetic wave and its frequency is around 1 trillion/sec. It is longest in the infrared rays and quite good for the physical health. Its characteristic likes both a ray and an electromagnetic wave and it affects the molecule of the body and also activates each cell. These phenomena are the reason why the metabolism is improved.

The materials in the nature which have the same characteristic as the above are a kind of igneous rocks like a basalt etc.

Since ancient times, it was said that these rocks have an effect on recovery of an external wound and the cause of the effectiveness of recovery is just the permeability by waves and the cultivation by rays. The effectiveness of these matters is caused by the long wave infrared rays which can reach inside of the body safely and activate each part.

3. How to use the activated sheet and its effectiveness

① Activation of water

Put water in the PET bottle into the activated sheet as the above photo for at least 6 hours. The water must be activated and its effectiveness is as follows.

- Get smooth-textured skin
- Improve constipation
- Improve hay fever
- Improve metabolism

② Activation of lotion

Put the bottle into the activated sheet as the above photo for at least 6 hours. Water in the lotion must be activated and the molecule of the activated water can permeate through the pore of the aquaporin in the cell easily so that it makes to increase moisture content of skin and activate each cell and then get smooth-textured skin.

③ Prevention of drips for meat and fish

Put the fillet or the round of a fish and the meat into the activated sheet or the activated the polyethylene seal for vacuum packing, and then keep it in the freezer. When thawing, there is almost no drip because the body fluid (60-70% is water) in each cell must be activated and restrained expansion.
